## KMedia Player

Media management software offers users with a simple means of listening to their songs, allowing them to manage their library, play media files, and enjoy quality MP3 audio content. Its interface is not as clean and modern as some other utilities and there are no online resources to help users get around the problem they encounter. But overall, it performs well, is easy to use and gets the job done. Yanhong Wu Abstract The Linear Free Surface (LFS) method has proven to be a highly accurate and promising numerical method for simulating waves of steep slopes with shock waves and nonlinear acoustic waves. This method has been applied successfully to the simulation of steep-slope waves in implosions and other applications. However, despite its high accuracy, the LFS method is still burdened by some common numerical difficulties: the numerical treatment of shock waves, the shock-capturing procedure, and discontinuities in the solution. This thesis takes a detailed look at the third difficulty in particular, and presents a comprehensive numerical approach for the simulation of smooth steep-slope waves with shock waves in the LFS method. First, a numerical procedure for shock waves is developed for simulating the steep-slope motion in heterogeneous physical systems. The numerical approach involves a highly accurate treatment of shock wave pressure and energy on both sides of the wave crest and a shock-capturing method that captures the behavior of steep-slope wave motion. Numerical results indicate that the shock wave between the steep-slope wave and a smooth wave can be treated accurately. The second stage of this study is aimed at improving the shock-capturing process of the LFS method for non-linear strong waves, in which a pseudo-time-evolving solution procedure is suggested. This approach requires updating the solution at every wave cycle. The solution procedure is based on solving the non-linear wave equation in a moving reference frame, and follows the flow of the solution itself, which is in a very different sense from the velocity-based formulation in traditional LFS code. Accurate non-linear waves are obtained for various nonlinear systems. Finally, the LFS method, combined with the proposed shock-capturing procedure, is applied to three problems in non-linear acoustic problems, including two-dimensional harmonic waves in compressible and incompressible fluids, and a three-dimensional cylindrical explosion. Numerical results and comparison with experimental observations are given for these problems
