If you plan to take up Photoshop as a profession, it's well worth buying the books and software to learn how to use it effectively.

**Resizing images** When you're working with graphics, you may need to resize an image. The most common way to do this is to make the image smaller in size (by cropping it, say, reducing the height and width by the same amount), or to expand it to fill a larger area. To do so, follow these steps: 1. Click Image ⇒ Image Size and select Cropping from the menu, or press Ctrl+3 on the keyboard. The Image Size dialog box opens. 2. Click the down-pointing arrows next to the dialog box and navigate through the presets, sizes, or crops. 3. Specify the size in pixels that the image will be resized to. 4. Click OK. You may need to enter a new size if you initially selected any size other than the smallest or largest option. This process resizes an image to its new size in pixels and stores it in the same filename. In some cases, it renames the file too. If you crop an image without resizing it, you don't have a good estimate of the file's dimensions or you just want a better view of the image in the image editor, you can always open the file in the editor and then simply crop and edit it to fit a particular space and size. You can resize and crop at the same time. If you want to resize a bitmap image and retain its quality, resize it to a maximum of 100 percent so that its quality isn't impacted when you shrink it. You can't resize an 8-bit grayscale image or a 16-bit RGB image. To continue resizing a 32-bit bitmap image, you have to convert it to 8-bit grayscale. The conversions are lossless, meaning that the original image quality is maintained.

**Creating resized PNG and TIFF files** Instead of resizing images using Photoshop, you may want to create a new image that's a perfect fit for the area you want to display it in. But the tools to create resized images are built-in to Photoshop. You can choose the size of the new image, and at the same time, create new files for it with PNG (Portable Network Graphics) and TIFF (Tagged Image File Format)

Some of the basics of Photoshop were introduced for the first time in Photoshop Elements. Not only that, but it also includes a new layer styles for the first time. It is possible to use classic Photoshop's layer styles in Photoshop Elements, but not the other way around. While Photoshop is better suited for photographic editing work than Photoshop Elements, Photoshop Elements is better suited for creating detailed images and photo manipulations. You can edit almost any image in Photoshop Elements, but the graphic editor lacks the image processing features of the regular Photoshop version. You can create new images, edit existing ones, and change the appearance of any image using Photoshop Elements. You can make changes in the color, brightness, contrast, and other parts of the image and save the finished results to another location. The process of creating a new image consists of three main steps: Selecting the subject Getting the background Choosing and naming the image file You can use Photoshop Elements for the first two steps of the process, but the last one is tricky.

**Step 1 – Selecting the subject** The first step is to select a subject and then to determine the size and resolution of the final image. In Photoshop Elements, when you open the image, you are able to select the subject by pressing the Ctrl or Command keys. When you are done selecting the subject, you are able to go to the next step.

**Step 2 – Getting the background** After selecting the subject, you have to select the background. To do this, you can use any of the two methods that you can use in Photoshop. You can use the gradient tool to draw the gradients on a new layer You can use the Pattern tool to create a bitmap pattern on a new layer The second method is much more flexible and easier. It is better suited for creating a detailed image where the subject is surrounded by a lot of details. You can use the white or black color as the background for the image. Most designers like to use the gradient tool, but the second method is much more powerful and flexible.

**Step 3 – Choosing and naming the image file** The last step of the

process is choosing the name of the image and opening it in Photoshop Elements. You can open the image in Photoshop Elements using the File menu in Windows and macOS. 05a79cecff

The invention relates to a method of manufacturing a semiconductor component in which an integrated circuit is fabricated on a substrate by using a thin-film deposition method, and to a semiconductor component. A semiconductor component, for example a memory chip, is typically produced from a substrate. If the semiconductor component is a memory chip, the substrate is a semiconductor wafer which has a multiplicity of identical semiconductor components. The substrate must typically have a certain thickness in order to provide a sufficient mechanical stability. In order to obtain a thick enough substrate, a wafer with a certain crystal thickness has therefore to be used. This is particularly the case when the substrate has a thickness of approximately 100  $\mu\text{m}$ . When the substrate has a thickness of around 100  $\mu\text{m}$ , the thickness of the semiconductor wafer is approximately 300  $\mu\text{m}$ . The fabrication of integrated circuits (ICs) by using thin-film deposition methods is widespread, since it is advantageous for cost reasons. Thus, use is generally made of the processes of chemical vapor deposition, physical vapor deposition and electron beam evaporation. A multiplicity of layers are deposited on the substrate and/or the substrate and the layers are patterned by etching. By way of example, it is possible to use silicon carbide, silicon nitride or titanium nitride as the material of the layers. The thickness of the layers is typically approximately 50 nm to 1000 nm. The processing of an edge region of the substrate is carried out by a thin-film deposition method, and a substrate cleaning is then carried out. Subsequently, a device layer is applied to the substrate. The device layer can be, by way of example, a silicon carbide, silicon nitride, a titanium nitride or a polycrystalline silicon, for example a layer with a thickness of up to 3  $\mu\text{m}$ . After the substrate is completely covered with layers, a so-called active edge region of the substrate is seen which must not be damaged, so that the active edge region can be used for the production of the integrated circuits. This is achieved by a cleaning process. This cleaning process is generally carried out by a process of an RCA type. If a thickness of the substrate of around 100  $\mu\text{m}$  is not sufficient, for example owing to the use of a thick substrate (with a thickness of 300  $\mu\text{m}$ ), an additional substrate is mounted. This additional substrate is then glued on the substrate of the semiconductor component. This is so that the substrate of the semiconductor

A suspect in a drive-by shooting outside his home is dead after exchanging gunfire with police. The gunfire broke out around 11:30 p.m. Monday at a home on the 4400 block of Delridge Way Southwest. At the time of the shooting, a female was home with her child, and a male was also home. The suspect was not inside the home but was firing shots outside of the home, hitting the victim and then a police officer. The officer was shot in the neck and then struck by his own service weapon, causing what the officer described as a "significant injury." "All I know is they just happened to be in the wrong place at the wrong time," said Delridge Way resident Arturo Ramirez. The male victim was shot multiple times but survived. At this time, information on his condition is not available. The suspect was later pronounced dead at a local hospital. "There was only one suspect," said Bexar County Sheriff's Office Sgt. Gilbert Ramirez. "There was some sort of attempted domestic violence on the initial call -- the domestic violence is what led to the shooting." The sheriff's office and Bexar County EMS have been working the scene since this incident occurred. "It's a good, busy street," said Delridge Way resident Matt Cobos. "Around 11 p.m., nothing is going on, except in the 3200 block of Delridge Way Southwest where a gunfight occurred." The street was blocked off with police tape as of 11:30 p.m., and neighbors said they can't help but think of the shooting as a random act of violence. "This is a typical block and it's usually very quiet," said Delridge Way resident Claire Rose. "It's very busy, so I wouldn't think about driving around here at 11 p.m. in the dark." The shooting comes less than one month after 14 women and children were killed at a Wal-Mart in El Paso. "I don't believe that it is gang-related," said Delridge Way resident Randy Wells. "When people hear gang-related things, they think of El Paso." The shooter in this incident is not known and there is no word on any other shooting victims. "We're frustrated we have no suspects," said Bexar County Sheriff's Office Lt. Carlos Ortiz. "We believe this was a targeted shooting." More
