New from AutoCAD 2009: Dynamic Input Events (DI) Dynamic Input Events (DI) is a set of data flow events that is entirely programmable within the drawing. DI are useful for designing and building user interfaces, which can be created without writing any code. If a user has both Static and Dynamic Input Events enabled on the drawing, then he/she will be able to use both types of events. If Static DI is used, then only Static DI events will be used, if Dynamic DI is used, then only Dynamic DI events will be used, and if neither Static nor Dynamic DI are used, then AutoCAD will use its standard mouse behavior. In addition to the mouse, there are other events that can be programmed to occur when a user performs specific actions in a drawing. The user's definition of which input events should occur when the user performs a specific action is the input event. If a user programs an action to be performed when he/she uses a particular mouse button, and the user clicks with the left mouse button, then

this action will be performed only when the left mouse button is used. Using DI, these functions can be created: A User Interface Builder An Initialization Wizard Form Builder Wizard Builder Customization also occurs through application-specific macros that are called during startup and workflows.
