An Interview with Christopher Daniels By Debbie Harlow Even when you're in the best shape of your life, there's always something left to improve. But when Chris Daniels improves, his skills and health improve even more. His remarkable progression to the peak of the sport of mixed martial arts makes him one of the most successful competitors in the sport today. In 2007, he won the King Of The Cage Middleweight Title with a brutal first round KO and in 2008 he won the prestigious Strikeforce Middleweight Title. "Since the day that I made my MMA debut in January 2003, Chris Daniels has been a living legend in the sport of mixed martial arts," says Dorian Roldan, M1 Global founder and CEO. "He is the definition of an athlete and sportsman. Mr. Daniels is known for being that rare commodity, a great athlete who is also an upstanding person." Daniels is in high demand for speaking engagements and recently appeared on "Jimmy Kimmel Live!" on ABC. He's extremely humble and unassuming as a speaker, but his background as a former NFL defensive back tells the story of an athlete who never let his past get in his way. "MMA is the hardest sport in the world," he says. "I don't think anybody makes it through life without getting knocked down once or twice." "Wrestling is real, but it's not real like MMA. It's a fantasy for me. I can't get hurt, and I can't lose," he continues. "Being a professional wrestler gives me freedom. I take the best that wrestlers have ever done and mix it up with the best in the world, and it's a perfect blend." In addition to being a highly talented competitor in the cage, Daniels is a father of two. He lives with his wife, Dominique, and their family in Cincinnati, OH. While he's a great father, he still has time for his past. "I go to too many events, some of which are televised. You can't just sit on your couch with nothing to do," Daniels says. "You have to keep moving, so I always try to stay busy. I'm focused on beating

Contribution of other blood components to neutrophil chemotaxis in normal subjects and ankylosing spondylitis patients. There is a report of increased elastase release by neutrophils in ankylosing spondylitis, as a mechanism for decreased chemotactic activity. However, this may reflect an increase in the amount of neutrophil-elastase complexed with plasma. Since neutrophils in vivo are exposed to a complex mixture of plasma and other blood components, we studied neutrophil chemotaxis in the presence of whole blood. In addition, we determined whether the protein content of whole blood influences neutrophil chemotaxis. To determine the effect of whole blood on neutrophil chemotaxis, the chemotaxis index (CI) was measured in whole blood in comparison with plasma or serum chemotaxis in normal subjects and in patients with ankylosing spondylitis. In addition, CI was measured in whole blood versus plasma in normal subjects. There was no difference in neutrophil chemotaxis between whole blood and plasma in normal subjects or ankylosing spondylitis patients. However, a small but significant difference was found in normal subjects between whole blood and serum in neutrophil chemotaxis, particularly at low neutrophil concentrations. We conclude that whole blood, rather than plasma, enhances neutrophil chemotaxis in normal subjects. There is no evidence that increased elastase release is the cause of the decreased neutrophil chemotaxis in ankylosing spondylitis. (16%) between these groups \[@B23-ijerph-13-00340\]. In a report by Iwamura et al. (2010), approximately 40% of the residents who received a home visit from a physician, one year after discharge from the hospital, had persistent memory loss and low MMSE scores \[@B24-ijerph-13-00340\]. The main limitation of our study was the inclusion of a relatively small sample size. However, our study is the first to assess the effects of social support on cognitive function in older adults at the community level. Our finding is consistent with other findings in the recent studies, despite a relatively small sample size. Another limitation was the long interval between baseline and follow-up MMSE scores. We were concerned about the possibility of a decline in cognitive function with time. However, it was difficult to measure and intervene for
